# OOP Practical Task — Part 1 Solutions

Access Modifiers: Predict the Compiler (BankLib & BankApp)

|---|---|---|
| **Student Name:** [Enter Name] | **ID:** [Enter ID] | **Marks:** 20 Marks |

| # | Compiles? (Yes/No) | Reason |
|---|---|---|
| **S1** | **Yes** | `Id` is `public`, so it is accessible everywhere including derived classes. |
| **S2** | **No** | `balance` is `private`, so it is only accessible inside the `Account` class itself. |
| **S3** | **Yes** | `pin` is `private protected`, and `SavingsAccount` derives from `Account` within the same assembly (`BankLib`). |
| **S4** | **Yes** | `branch` is `internal`, and `SavingsAccount` is in the same assembly (`BankLib`). |
| **S5** | **No** | `owner` is `protected`, and `Auditor` does not inherit from `Account`. |
| **S6** | **Yes** | `iban` is `protected internal`, which is accessible to any class within the same assembly (`BankLib`). |
| **S7** | **Yes** | `owner` is `protected`, and `Customer` derives from `Account` (even across assemblies). |
| **S8** | **Yes** | `iban` is `protected internal`, so it is accessible in derived classes like `Customer` in another assembly. |
| **S9** | **No** | `pin` is `private protected`, so it is not accessible in a derived class located in a different assembly (`BankApp`). |
| **S10** | **No** | `branch` is `internal`, so it cannot be accessed from outside `BankLib`. |
| **S11** | **Yes** | `Id` is `public`, so it is accessible from any class in any referencing assembly. |
| **S12** | **No** | `iban` is `protected internal`, and `Teller` is neither in `BankLib` nor derived from `Account`. |
